

Spotlight

Hytrol's Expressway belt sawtooth offers an all new concept in sawtooth merges. It consists of a belt-over-roller design. The rollers extend beyond the belt into the "tooth" where their diameter is increased. This increased diameter allows merging cartons to transition onto the belt. The tooth also contains a powered guide rail to positively convey merging product through the "tooth" area.

The Expressway is modular in design, allowing it to be easily configured for your particular requirements.

FEATURES

- Quiet Operation
- Positive carton merging
- High Speed
- Trackable Cartons
- Modular Design
- Robust Construction

SPOTLIGHT

A Publication by

Hytrol Conveyor Company, Inc.
Effective October 2004

COMPONENT PROFILES

Belt-Over-Roller design for tracking products

Powered Guide Rail in tooth area for accurately tracking cartons through merge

High Friction Belt Surface on rollers for accurate belt tracking.

APPLICATION

The Expressway is designed for high speed merge application prior to sorting cartons for warehousing or distribution.
